What is a microgrid & how does it work?

A microgrid is a group of interconnected loads and distributed energy resources that acts as a single controllable entity with respect to the grid. It can connect and disconnect from the grid to operate in grid-connected or island mode. Microgrids can improve customer reliability and resilience to grid disturbances.

What is a microgrid report?

This report provides (1) an overview of the microgrid planning, assessment, and design process for DoD installations and (2) is a resource for energy managers, policymakers, contractors, and other stakeholders involved in microgrid projects.

How do you plan a microgrid?

Define site goals and needs. An agency or site will first need to identify energy goals, critical loads, and resilience needs. Evaluate on-site DERs and controls systems. Evaluate existing on-site DERs and controls systems to determine how they may be used in a planned microgrid. Microgrids are deeply integrated with existing infrastructure.

Can a microgrid be installed in the DoD?

Currently, for installation-scale microgrids in DoD, most projects include medium or low levels of renewable energy. Several projects with high levels of renewable energy have been developed and successfully executed at DoD installations, but these are typically at smaller scales.

Where can I find an example of a microgrid project?

Watch "Islanding a Microgrid" for an example of microgrid project execution at a federal campus at [energy.gov/eere/femp/articles/islanding-microgrid](http://energy.gov/eere/femp/articles/islanding-microgrid). Illustration by Brittany Conrad, NREL

Who owns a microgrid?

Independent of whether the microgrid is owned by the customer, the distribution utility or a third party, the utility is responsible for maintaining grid stability, ensuring reliability, and providing grid services. The utility accomplishes this in one of two ways.
